SECURITY SOLUTIONS
HOW SECURE IS YOUR ORGANIZATION?

A sound approach to security requires a comprehensive strategy to protect your business from the numerous attack angles being utilized by hackers today. The ability to adapt a protection strategy to combat the ever-changing threat landscape is now a priority for most businesses. Although gaining an understanding of where you are well protected and where you may need to improve can be difficult, understanding your current state is an important step in making sure your business is not vulnerable to attacks. Sirius Computer Solutions can help.

SIRIUS SECURITY ARCHITECTURE REVIEW

The Sirius Security Architecture Review helps create an understanding of your security controls and identify areas where improvements can be made. During this complimentary three-hour session, our certified security consultant will review your current security posture to identify any gaps. Once the review is complete, our consultant will prepare a one-page diagram outlining the current state of your security measures and identify any potential areas of improvement.

Please contact your Sirius client executive for more information about scheduling a complimentary review.

HOW YOU WILL BENEFIT

The Sirius Security Architecture Review is targeted toward senior management who have responsibility of overseeing their organization's security posture. Ideally a session will include personnel that understand the current controls in place, such as security administrators, application owners, and network managers. In addition, the CISO and CIO can benefit from the discussion that takes place and the deliverable that is created. Technology is discussed at a high-level during the session, but the review will not be a technical "deep-dive" into specific security technologies.

The discussion of your overall architecture and approaches to various threats helps to create a visual tool that will be left behind for future reference. Additional ways you and your organization will benefit:

- Develop a high-level understanding of your security controls
- Identify security areas that may require attention
- Prioritize where to focus potential changes or enhancements to your security
