

The Sirius SDx Innovation Center (SDxIC) allows our clients to experience, in person, the power of software-defined solutions in a fully integrated lab environment. The center is staffed by architects highly skilled in data center disciplines.

The SDxIC provides a venue in which the adoption and integration of new technologies can be vetted and proved. It's been uniquely equipped to allow the deployment of new technologies alongside traditional infrastructure environments in order to proof migration paths or coexistence strategies.

THE SIRIUS SDx INNOVATION CENTER

DEMONSTRATIONS

The Sirius SDx Innovation Center (SDxIC) offers demonstrations in multiple technologies including, but not limited to, Cisco® Application Centric Infrastructure (ACI) software-defined networking solutions, VMware® NSX software-defined networking solutions, dual data center, and various other technologies.

WORKSHOPS

Sirius offers workshops tailored to your requirements and needs. You'll work with Sirius SDxIC architects to design solutions, test configurations, or review your current architecture and discuss recommended changes for your environment.

PROOF-OF-CONCEPT EVENTS

Sirius offers proof-of-concept events to fit your needs. SDxIC architects work to define and build your new production environment alongside an operationally accurate simulation of your legacy environment. The resulting, carefully defined configurations enable and validate a seamless transition between (or coexistence of) the old data center and new SDx architectures.
